central administrations. In such a case, the commissariat also has a deputy for cadres, i.e., the deputy of the commissar who is in charge of only the cadres of the given commissariat, not of the personnel of the central institution, but of the cadres of the entire periphery of this commissariat. For example, the commissariat of ferrous metallurgy does not have a deputy for the affairs of cadres because there is only one commissariat of ferrous metallurgy, that in Moscow, however, there are no such commissariats in the republics of the Soviet Union.

special deputy chief of the deputy commissar who is in charge of this ce administration.	ntral

	50X1 periphery. e of each ry extends me instanc authorize em strange
A commissariat does not have a department for the administration of the There is no such central administration. The commissariat of agricultur republic, of each oblast has its own division. Furthermore, the periphe to the rayon, the rayon executive committee and even reaches down, in so to very small centers which have rayon departments of agriculture, or an representative of the department of agriculture. Therefore, it might se that the people's commissariat of agriculture itself does not have a dep	50X1 periphery. e of each ry extends me instanc authorize em strange

it always does, according to Soviet traditions; then to improve the machinery for increasing the working-capacity of the people; for raising their qualifications; and to train them in skills. Each one of these departments for supervision of cadres under the administration of the commissariat, has under its directorship, specialized institutes, such as the institute of livestock-raising industry, which trains cadres for the livestock-raising industry, veterinaries and so forth. This institute is under the supervision of the main administration for cadres of the commissariat of agriculture. All of the above-mentioned things represent fairly large and complex functions; all of them are placed under the administration of the special deputies of the commissars.

It might seem strange, however, that there is no division to run the periphery, i.e., the people's commissariats of agriculture of the republics, agricultural departments of the oblasts, the rayon agricultural departments and so on. This is explained by the fact that, according to Soviet traditions, administration is set up along specialized lines. The grain economy would be managed by the people's commissariat of a republic, for example, the commissariat of the Ukrainian SSR. This is because none of the commissariats of the republics have within them central administrations but only departments such as: the department of livestock-raising and the department of industrial crops. The existence of the latter, however, depends on whether the specific republic raises industrial crops or not, and if it does not, then naturally, there will be no department for industrial crops. Let us take, for instance, some place like the Archangelsk kray; this area does not have a department of industrial crops, while the Crimea has a department for tobacco-raising, because

		50X1-HUM
Prior to embarking upon its work of drafting the national econom USSR, the demographic section of the Gosplan puts forward a defitit is not really called a plan until it is ratified, but a hypothypothesis is on the natural population increase for the next year; the rate of birth; the mortality of children, of adults, comortality; the migration of people, that is, from district to dit to city and so forth. Next, an estimate is made of the total payear, i.e., the year that is being planned. This estimate is made each age group separately: children up to one year, first; then five, or four, that is, up to school-age. The age group from five under the heading of the contingents for children's homes, while i.e., from one to two or three, is listed as the contingents for Next follows the school-age group, but this group is not taken sestimated for each year separately. Then follows a re-shifting in the current year are considered by the end of the planned year year-old group, while those who were in the former group, i.e., one, are shifted to the second group. This re-shifting gives in age-group composition of the population for the planned year. To of the total population for the next year on the basis of subtrafrom another, i.e., the birth-rate minus death-rate and minus the form another, i.e., the birth-rate minus death-rate and minus the form another, i.e., the birth-rate minus death-rate and minus the form another, i.e., the birth-rate minus death-rate and minus the form another, i.e., the birth-rate minus death-rate and minus the form another, i.e., the birth-rate minus death-rate and minus the form another, i.e., the birth-rate minus death-rate and minus the form another is the form another is the first and minus the form another is the first and minus th	inite hypothe thesis. This sar. The formation for the first and variet and variet and variet and for each, children for the children for the children's as whole, but, i.e., those ar into the u in the grouph the final of the comes the action of one	mulation e current general illage the next year and om one to n five or is listed ge-group nurseries. is born p-to-one- up to utcome the e planning figure
In all other countries population growth is estimated as a hypot the estimated increase is entered into the plan and is submitted of the Gosplan for its ratification. After its ratification, the out copies of it to all of the Gosplan's planning offices, the craising, the office of, let us say, agriculture, the office of also that of the communal economy, as well as schools and hospit is then used as a guide in determining the planned assignments. been done, the Gosplan could not carry on its work. It was discovered in 1939 that there was only gent of school children to be found that year. It turned out that the 1932 and 1933 birth-rate was so low and the state of the countries of the countrie	i to the pressure presidium office of liverous metalicals. -5-

In most instances they arise on the ground of a different concept as to what constitutes the correct geographical allocation of the assignments. For example: an assignment is given to the People's Commissariat of Local Industry to increase its output by 20% in small-scale, metal-pocessing plants. The Commissariat of Local Industry looks at this from the following point of view: In what area can this increase be obtained in the easiest possible way? Let us say that it has decided that the easiest way to obtain it will be in the Ukraine. Having come to this conclusion, it shifts the entire assignment, or nearly all of it, to the Ukraine, because the administrative machinery is better organized in the Ukraine and it is easier to find resources for building new, small-scale plants. However the government's directive had an altogether different objective in mind. It wanted the 20% distributed in such a manner as to increase local industry in the Urals, and also in Siberia—where the local industry is needed so badly—as well as in the Far East—where it is needed so desperately and where it does not exist or barely exists.

But the people's commissariat is afraid that by following this course it will fail to fulfill its assignment. Such is the principal, the basic type of dispute and it is usually settled either in the Council of People's Commissars of the USSR, or, if it has not been settled there, in the Central Committee of the Party.

50X1-HUM 50X1-HUM

the second source of friction

is connected with the assigning of definite timetables for the fulfillment of a task. Let us suppose that the People's Commissariat of Ferrous Metallurgy was faced with the task of increasing the production of cast-iron from 18 million to 19 million tons a year. The Commissariat will fulfill the task in such a manner that the additional million tons will be produced only in the fourth quarter. The Commissariat reasons that in order to produce the additional one million tons in the existing plants it would be necessary to improve the blast furnace processes, to reduce the sulphur content of the coke, and to decrease the amount of waste. In short, by means of improving the production method itself. In place of increasing production by some 200,000 or 300,000 tons every quarter, it prefers to build one or two blast furnaces in one plant. The new capacity will be ready for production in the fourth quarter and then they can produce the additional one million tons required for the year. In the meantime the Gosplan expects that there will be some augmentation in the first quarter and in the second quarter, because there are consumers for it both in the first quarter and in the second. The total production figure in the supply plans is 19 million tons and it is distributed over the four quarters of the year, but as for the People's Commissariat, it is easier for it to produce the additional one million tons in the fourth quarter. --...

The People's Commissariat started the construction of additional production capacity in the preceding year. It is not in any hurry, and will put these facilities into operation in the fourth quarter of the Plan year. This is not in accordance with the national interest and the State Plan and the conflict between the People's Commissariat and the Cosplan is again settled by the Council of Ministers or the Central Committee of the Party.

20.

19.

This applies particularly to the People's Commissariat of Trade. It has endless and continuous arguments with the Gosplan. The Commissariat always tries to postpone everything to the end of the year. In the meantime, people are in need of pants, milk, or clabber. There is a demand for these items every day, but they prefer to carry all this over to the fourth quarter.

21.

Declassified in Part - Sanitized Copy Approved for Release 2012/11/01: CIA-RDP80-00926A004500020002-0 CONFIDENTIAL/US OFFICIALS ONLY/SECURITY INFORMATION 50X1-HUM tion, quarterly plans were introduced, beginning in 1933. These plans were subject to confirmation by the all-Union Government. This, too, however, turned out to be inadequate. In the course of the quarterly period, difficulties arose, seasonal difficulties, forcing the introduction of monthly plans, but only for republican industries. This course, which in my opinion is absurd, was carried to even greater extremes when the Government introduced ten-day plans in enterprises, and then daily plans for each bench in a factory. This resulted in such great bureaucracy in planning that after a while no one was able to check on how this entire anarchy, this pulverized system of planning was being carried out. Toward the end of the thirties there was such a mix-up that it became imperative to abolish those daily plans. The ten-day plans, however, remained in force at enterprises. This means that every enterprise must draw up ten-day plans based on the prescribed monthly plan. 22. this in addition to monthly plans But this was only for industries functioning on a union republic level; those on an all-union level had only quarterly plans. Many a planner foresaw a complete crash of the Soviet economic structure in this entire process of confusion, all those daily assignments, and so forth. This entire process is called "carrying the plan to the individual worker." 50X1-HUM 23.

dominated by market fluctuations, and not by planning, not by the will of the state.

This is not simply a changing of the form of work but a basic and radical transformation of the Communist Party's point of view on the nature of the Soviet economy. The attitude of the Communist Party leadership since 1930 has been that it was no longer possible to permit any influence of capitalistic elements. The publications reviewing the fulfillment of the economic plan focused

about objective situations were proclaimed conservative, alien to the Soviet economy,

because it was just in that time that the Soviet economy began to be called Socialist economy, in contradistinction to the capitalistic economy, which is

-10-

50X1-HUM

50X1-HUM

their attention not on statistics, but on the quest for those responsible for the failure of the plan. Strictly speaking this was a report on the guilty, an indictment of individual persons, even republics and oblasts. This is why you will find fewer statistics and more facts, more assessments of the condition of the 50X1-HUM economy in these reports. And what is more, willy nilly, they become absolutely for example guilty of having caused the frank because, in order to show failure of the plan, it is necessary to bring up arguments in support of the accusathis document is the most important document tion. And this is why for the study of the economy of the USSR, much more important than the National 50X1-HUM Economy Plan.

But of course, this does not mean that you will not find figures in these documents. You will find them contained in tables arranged as follows: First column: Target for the period covered by the plan--let us say the Pyatiletka, or a year, or a quarter within the year, or a month within the year. Then follows the fulfillment of the plan of the preceding parts of the period covered by the plan: Let us take the year 1946. The plan was: 100 units. The report is on the fulfillment of the plan in the third quarter, Fulfillment during the two preceding quarters is 40 which constitutes 40%. Fulfillment of the plan in the third quarter, that is, during the quarter under review is 22, which is 22%. The total fulfillment covers three quarters. Three quarters: 62%. You will find therefore, factual and valuable material which even provides a picture of the dynamics of the fulfillment of the plan.

		III	quarter 1946			.5'
Plan	First and 2n	d Quarters	3rd Quar	ter	Total	
	Quantity	%	Quantity	%	Quantity	%
100	40	40	22	22	62	62 50X1-HUM
	th	is report			I	50X1-HUM

To begin with, it is published in three forms. The first form is the one published in the "Planned Economy." It is very modest, taking up two pages, perhaps. This is all the public gets. Thus, in any publication of the "Planned Economy" you can find these modest indices.

taken from this report 50X1-HUM

The second form is more extensive and is a book containing approximately 100 to 150 pages. It is published in 3,000 copies and is intended for use by top level officials of the USSR, but only those top-level officials who work in the administrative and economic fields. This book is fairly comprehensive and is, in addition, classified as "secret." Each copy is numbered. And finally, the third form of the book is a masterpiece. It contains a considerably greater number of indices, and is more frank.

There one may find the real reasons for plan non-fulfillment. In looking over this book, you can see why and where a plan was not fulfilled, where things are really bad and where there is a catastrophe. In addition you see even names, the names of plants and so on. This book is published in 250 to 300 copies. Usually 300 copies. Copies of the book are not only numbered, but also contain on the cover sheet the name of the person for whom they were intended: "For Comrade Stalin" or "For Comrade Malenkov." In view of the fact that this book is issued in only 300 copies, it circulates among a very limited group of epople. These, in the first place, are members of the Politbureau, members of the Central Executive Committee of the Party, in other words, mainly the party leadership.

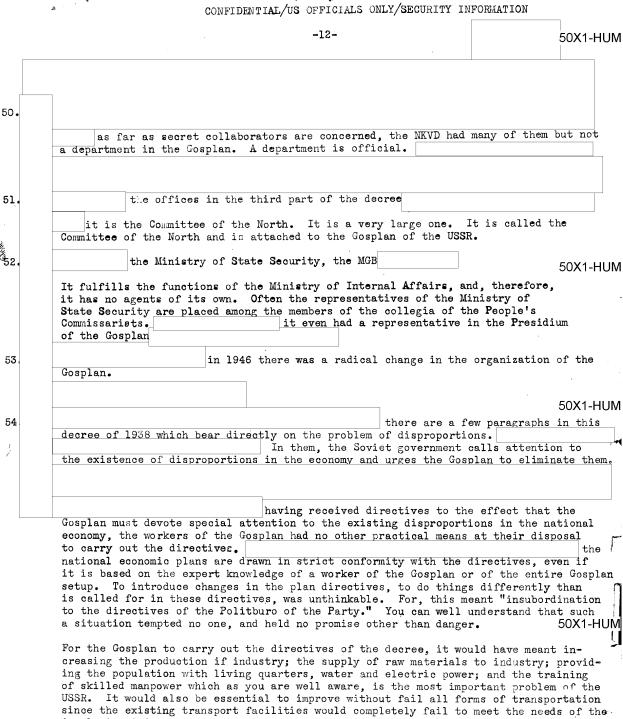

This book is invariably sent to the Secretary of the Central Executive Committee of the Party in each republic. But the Chairman of the Council of People's Commissars of the republic in question does not receive this book. He receives a copy of the second category.

developing industry and of the entire national economy. And finally it would be essential to raise the level of agricultural output to meet the needs of industry and to satisfy the population's minimum needs in foodstuffs. A comparison of the two figures bearing on the last point will reveal a considerable disproportion within the USSR economy.

In 1940 the areas under grain crop increased by only 12% as compared with 1913, and the yield was greater by eight to eight and one half centners, an increase of 25 or 26%. However the population increased during that period by 60 to 70%. This alone shows you the colossal disproportion. Furthermore, the demands of industry for agricultural raw materials also greatly increased during that period. What was the position of the Gosplan? Was it in a position to decide that available building materials, material resources and money appropriations be directed not to the development of metallurgy or machine building, but to the development of agriculture, to the development of transportation, electric power, water supply, i.e. to the development of consumers' industry and thus slow down the tempo of industrialization. It is perfectly clear that nobody in the USSR would dare take such a step. The first chairman of the

50X1-HUM

-13-

Gosplan Kryzhanovsky, tried to take such a step and his fate is known It was also tried by Smirnov, another chairman of Gosplan who lasted for only nine months.

it was a mistake on the part of the Government to include the paragraph on disproportions in the statute of the Gosplan, because in the first place, the Government admitted the existence, of disproportions in the USSR, a thing which the Soviet Government and the Communist Party, always denied. And second, because by the same token it underscored the fact, that the disproportions became so large that it was necessary to give to the Gosplan a special mission to take care of this situation and to eliminate these disproportions. However, by doing this the Government did win a point. It shifted responsibility and created a scapegoat. It could now bring to trial people, not guilty for these disproportions. These disproportions were in fact the result of wrong planning, a mad race after increased industrialization dictated by the Party--the Politburo--and to which the Gosplan followed mechanically in drawing up plans.

50X1-HUM

55.

The Government not only charged the Gosplan with the task of liquidating disproportions but also indicated the course it should follow in connection with this task. Had the Government been reasonable, it would have said to the Gosplan as follows: Since you have been charged with the duty of eliminating disproportions, you should tell us, upon the receipt of the directives from the Polithereau, that these directives were not reasonable, since implementing them would intensify dislocations even more.

Such, it seems should have been the case. However, this was not the course they followed. Instead they issued a directive which states: "The Gosplan is to coordinate all branches of the economy and with this in view it is to compile material balances." The Government understood perfectly well that not a single material balance could be drawn up by the Gosplan under the prevailing conditions which governed the drafting of the plan. It was physically impossible, for the following reason: There are two sides, two aspects to any material balance. On the one hand there are the resources or the assets and there are the requirements to carry out the plan objectives.

If you should attempt to draw up a material balance for any segment of time, whether it be a five-year period, a year, or a quarter, covering any branch you may desire, or any items you may wish, be it metal, canned goods, machine tools, electrical equipment, generators, transformers, pants, tables, any item at all, if you try and draw up such a balance you will invariably obtain a picture of a colossal deficit. You draw up your requirements, your most modest, minimum requirements computed on the principle of "plugging up holes" in the most vital spots, and you get, for example, the figure 100. You then turn to the resource part of your balance, the assets, and you will discover that the country is producing, and will be able to produce in the coming year, under existing capacity only 25 to 30% of the requirement. This is true for almost any commodity, any item you might mention.

The Government was well aware that the drawing up of such a balance, if it had been drawn up, would have opened the eyes of whoever was drawing up the plan, that the disproportion could not be reduced.

The directive to draw up material balances was issued in 1938 but by 1941 the Gosplan had not issued a single material balance. It could not issue any, because it would have been a most severe blow at the Government itself. It would have meant the complete discrediting of state planning as a system. This, of course, was so dangerous, that the government decided not to press the Gosplan to carry out the directive relating to material balances.
